Package 'kyotil'

October 24, 2018

LazyLoad yes

LazyData yes

Version 2018.10-17

Title Utility Functions for Statistical Analysis Report Generation and Monte Carlo Studies

Depends R (>= 3.1.3)

Imports methods

Suggests RUnit, lme4, nlme, xtable, MASS, splines, survival, abind, pracma, VGAM, copula, mvtnorm, Hmisc, RColorBrewer, zoo

Description
Helper functions for creating formatted summary of regression models, writing publication-ready tables to latex files, and running Monte Carlo experiments.

License GPL (>= 2)

NeedsCompilation yes

`age_calc` *Age Calculation*

Description

Calculate age, by Jason P Becker, modified very slightly in how arguments are passed to the function.

Usage

```
age_calc(dob, enddate = Sys.Date(), units = c("days","months","years"), precise = TRUE)
```

Arguments

`dob`	POSIXlt or Date. Birthday
`enddate`	POSIXlt or Date. Date to compute age
`units`	string. Choose a unit.
`precise`	Boolean.

Author(s)

Jason P Becker

References

http://blog.jsonbecker.com/2013/12/calculating-age-with-precision-in-r.html

Examples

```
age_calc (dob=strptime("29OCT2002", format="%d%b%Y"),
    enddate=strptime("30OCT2003", format="%d%b%Y"), units='years', precise=TRUE)
age_calc (dob=strptime("29OCT2002", format="%d%b%Y"),
    enddate=strptime("30DEC2003", format="%d%b%Y"), units='years', precise=FALSE)
```

---

base.functions *Some Base Functions*

Description

cbinduneven binds together a list of matrixes/dataframes of different lengths, rows are matched by names binary returns binary representation of an integer. binary2 returns binary representatin of an integer with leading 0, the length of string is n. mysystem can call any exe file that is in the PATH f2c convert temperature from f to c/

Usage

```
cbinduneven(li)
binary(i)

multi.outer (f, ... )

myreshapelong(dat, cols.to.be.stacked, label.cols.to.be.stacked, new.col.name)

binary2(i, n)

f2c(f)

ftoi(f)

keepWarnings(expr)

meanmed(x, na.rm = FALSE)

methods4(classes, super = FALSE, ANY = FALSE)

myaggregate(x, by, FUN, new.col.name = "aggregate.value", ...)

myreshapewide(formula, dat, idvar, keep.extra.col=FALSE)

mysapply(X, FUN, ..., simplify = TRUE, USE.NAMES = TRUE, ret.mat = TRUE)

myscale(x)
```

```
mysystem(cmd, ...)

mytapply(X, INDEX, FUN = NULL, ..., simplify = TRUE)

read.sv(file, header = TRUE, ...)

read.tsv(file, header = TRUE, sep = "\t", ...)

table.prop(x,y=NULL,digit=1,style=2,whole.table.add.to.1=FALSE,useNA="ifany",
    add.perc=FALSE, add.total.column = FALSE)

table.cases  (case,group,include.all=TRUE,desc="cases")
table.cases.3(case,group1,group2)

unix()

mycor (x, use = "everything", method = c("pearson", "kendall", "spearman"),
    alternative = c("two.sided", "less", "greater"), exact = NULL,
    conf.level = 0.95, continuity = FALSE,
    digits.coef=2, digits.pval=3,
    ...)
```

Arguments

add.total.column	
use	
method	
alternative	
exact	
conf.level	
continuity	
digits.coef	
digits.pval	
cols.to.be.stacked	
label.cols.to.be.stacked	
li	a list
i	
n	
f	In multi.out, f is a function.
case	vector of 0/1

group	vector of multi-group indicators
formula	a formula object.
expr	
x	
na.rm	
classes	
super	
ANY	
desc	
by	
whole.table.add.to.1	Boolean
new.col.name	
...	
dat	
idvar	
X	
simplify	
USE.NAMES	
ret.mat	
cmd	
INDEX	
file	
header	
sep	
y	
digit	
style	
FUN	
keep.extra.col	
useNA	
add.perc	
include.all	
group1	
group2	

Examples

```
binary(5) ###  101
binary2(5, 4)

a=data.frame("x"=1:2)
b=data.frame("y"=3:5);#rownames(b)[3]=""
cbinduneven(list(a,b))

## Not run:
# the formula in myreshapewide can only have one variable in the right hand side
    myreshapewide(fi~week, dat, c("ptid","stim"))

    myreshapelong(dat.201.neut, cols.to.be.stacked=c("MN.3","SF162","SVA.MLV"),
        label.cols.to.be.stacked="antigen", new.col.name="y")

    myaggregate(subset(dat.poc, select=c(HIV, trt)), list(dat.poc$f), function(x)
      with(x, c(fisher.test(HIV, trt)$estimate, fisher.test(HIV, trt)$p.value)))

## End(Not run)
```

`cox.zph.2` *Test the Proportional Hazards Assumption of a Cox Regression (a slightly modified version)*

Description

A slightly modified test of the proportional hazards assumption for a Cox regression model fit (coxph). This version corrects some conservativeness of the test.

Usage

```
cox.zph.2(fit, transform = "km", global = TRUE, exact=TRUE)
```

Arguments

`fit`	
`transform`	
`global`	
`exact`	Boolean. If FALSE, this function is an identical copy of cox.zph. If TRUE, it computes the variance of the test statistic exactly, instead of approximately.

Details

When the model uses time-dependent covariates, the approximation used in Grambsch and Therneau resulted in conservativeness of the test. This is "fixed" here at a cost of up to 2.5 times longer execution time.

References

Fong, Y. and Halloran, M Elizabeth and Gilbert, P. Using Time-Dependent Age Group in Cox Regression Analysis of Vaccine Efficacy Trials, Just Another Epi Journal, in prep.

See Also

cox.zph

Examples

```
library(survival)
fit <- coxph(Surv(futime, fustat) ~ age + ecog.ps,
             data=ovarian)
temp <- cox.zph(fit)
print(temp)
temp.2 <- cox.zph.2(fit)
print(temp.2)
```

Deming *Fit Deming regression.*

Description

Deming regression fit. Assume x and y variances are the same. Slightly modified from MethComp R package.

Usage

```
Deming(x, y, vr = sdr^2, sdr = sqrt(vr), boot = TRUE, keep.boot = FALSE,
    alpha = 0.05)
```

Arguments

x

y

vr

sdr

boot

keep.boot

alpha

Examples

```
## Not run:
set.seed(1)
x=rnorm(100,0,1)
y=x+rnorm(100,0,.5)
x=x+rnorm(100,0,.5)
fit=Deming(x,y, boot=TRUE)
summary(fit)
plot(x,y)
abline(fit)
# compare with lm fit
fit.1=lm(y~x, data.frame(x,y))
summary(fit.1)
abline(fit.1, col=2)

## End(Not run)
```

DMHeatMap *Better Heatmap Function*

Description

Makes a heatmap representation of correaltion coefficients easier.

Usage

```
DMHeatMap(x, Rowv = TRUE, Colv = if (symm) "Rowv" else TRUE, distfun = dist,
    hclustfun = hclust, dendrogram = c("both", "row", "column", "none"),
    symm = FALSE, scale = c("none", "row", "column"), na.rm = TRUE,
    revC = identical(Colv, "Rowv"), add.expr, breaks,
   symbreaks = min(x < 0, na.rm = TRUE) || scale != "none", col="heat.colors", colsep,
    rowsep, sepcolor = "white", sepwidth = c(0.05, 0.05), cellnote, notecex = 1,
   notecol = "cyan", na.color = par("bg"), trace = c("column", "row", "both", "none"),
   tracecol = "cyan", hline = median(breaks), vline = median(breaks), linecol=tracecol,
    margins = c(5, 5), ColSideColors, RowSideColors, cexRow = 0.2 + 1/log10(nr),
   cexCol = 0.2 + 1/log10(nc), labRow = NULL, labCol = NULL, labColor = NULL, key =TRUE,
   keysize = 1.5, density.info = c("histogram", "density", "none"), denscol = tracecol,
    symkey = min(x < 0, na.rm = TRUE) || symbreaks, densadj = 0.25, main = NULL,
   xlab = NULL, ylab = NULL, lmat = NULL, lhei = NULL, lwid =NULL, lower.left.only=TRUE,
    ...)
```

Arguments

x

Rowv

Colv

distfun
hclustfun
dendrogram
symm
scale
na.rm
revC
add.expr
breaks
symbreaks
col
colsep
rowsep

Examples

```
cor=matrix(runif(15),5,3)
breaks=c(-1,-.7,-.5,-.3,-.1,.1,.3,.5,.7,1)
hU=DMHeatMap(cor, trace="none", symm=FALSE,dendrogram="none", col=RColorBrewer::brewer.pal(
   length(breaks)-1,"RdYlGn"), distfun = function(c) as.dist(1 - c), cexRow =1.5, cexCol =1.5,
   lmat=rbind( c(2, 1), c(4,3) ), lhei=c(4, 1 ), breaks=breaks, margins=c(2,2), key = FALSE,
    Rowv=NA, lower.left.only=FALSE)
```

---

get.sim.res *Read simulation results*

Description

Go through a folder and read all files and combine the results into a multidimensional array.

Usage

```
get.sim.res (dir, res.name="res", verbose=TRUE)
MCsummary (dir, res.name = "res", exclude.some = TRUE,
                  exclude.col = 1, verbose = TRUE)
getFormattedMCSummary (path, sim, nn, fit.method, exclude.some = TRUE,
                  exclude.col = 1, verbose = TRUE, coef.0 = NULL, digit1
                  = 2, sum.est = c("mean", "median"), sum.sd =
                  c("median", "mean"), style = 1, keep.intercept =
                  FALSE)
```

Arguments

`dir`	directory of MC result files
`path`	partial path to the directory of MC result files
`res.name`	name of the R object saved in the files, default is res, but may be others
`verbose`	Boolean
`sim`	a string to denote simulation setting
`nn`	a vector of sample sizes
`fit.method`	a string to denote fitting method. sim, nn and fit.method together forms the name of the directory containing MC result files
`exclude.col`	column number
`exclude.some`	whether to exclude MC results that are extreme
`coef.0`	simulation truth
`digit1`	digits
`sum.est`	use mean or median as location estimate summary
`sum.sd`	use mean or median as sd estimate summary
`style`	integer
`keep.intercept`	whether to include intercept in the table

Details

Depends on package abind to combine arrays from files.

Value

A multidimensional array.

`getK` *getK*

Description

`getK` calculates the kernel matrix between X and itself and returns a n by n matrix. Alternatively, it calculates the kernel matrix between X and X2 and returns a n by n2 matrix.

Usage

```
getK (X,kernel,para=NULL,X2=NULL,C = NULL)
```

Arguments

X	covariate matrix with dimension n by d. Note this is not the paired difference of covariate matrix.
kernel	string specifying type of kernel: polynomial or p (1 + <x,y>)^para, rbf or r exp(-para*||x-y||^2), linear or l <x,y>, ibs or i 0.5*mean(2.0 - |x-y|) or sum(w*(2.0 - |x-y|))/sum(w), with x[i],y[i] in 0,1,2 and weights 'w' given in 'para'. hamming or h for sum(x == y) with x[i],y[i] binary, no default.
para	parameter of the kernel fucntion. for ibs or hamming, para can be a vector of weights.
X2	optional second covariate matrix with dimension n2 by d
C	logical. If TRUE, kernels are computed by custom routines in C, which may be more memory efficient, and faster too for ibs and hamming kernels.

Details

IBS stands for 'Identical By State'. If 'x','y' are in in 0,1,2 then
IBS(x,y) = 0 if |x-y|=2, 1 if |x-y|=1, 2 if |x-y|=0, or IBS(x,y) = 2.0 - |x-y|.
K(u,v) = sum(IBS(u[i],v[i])) / 2K where K = length(u).
The 'hamming' kernel is the equivalent of the 'ibs' kernel for binary data. Note that 'hamming' kernel is based on hamming similarity(!), not on dissimilarity distance.

Within in the code, C is default to TRUE for ibs and hamming kernels and FALSE otherwise.

Value

A kernel matrix.

Author(s)

Youyi Fong <youyifong@gmail.com>
Krisztian Sebestyen <ksebestyen@gmail.com>
Shuxin Yin <>

Examples

```
X = cbind(x1=rnorm(n=5), x2=rnorm(n=5))
dim(X)
X2 = cbind(x1=rnorm(n=3), x2=rnorm(n=3))
dim(X2)

K = getK(X,"linear")
dim(K)

K = getK(X,"linear",X2=X2)
```

```
dim(K)
K1 = getK(X2,"l",X2=X)
dim(K1)
all(K==t(K1))

# RBF kernel
K = getK(X,"rbf",para=1,X2=X2)
K1 = getK(X2,"r",para=1,X2=X)
all(K==t(K1))

# IBS kernel for ternary data
X <- as.matrix(expand.grid(0:2,0:2))
K = getK(X,kernel = 'ibs')

# add weight
w = runif(ncol(X))
K = getK(X,kernel = 'ibs',para = w)

# IBS kernel for binary data via option 'h' for 'hamming similarity measure'
X <- as.matrix(expand.grid(0:1,0:1))
K=getK(X,kernel = 'h')
```

`kyotil` *kyotil*

Description

Utility functions by Youyi Fong and Krisz Sebestyen, and some functions copied from other packages for convenience (acknowledged on their manual pages).

Most useful functions: mypostscript/mypdf, mytex,

See the Index link below for a list of available functions.

The package depends on Hmisc. The main reason for that, besides the usefulness of the package, is Hmisc depends on ggplot2, which also define

---

`make.timedep.dataset` *Create Dataset for Time-dependent Covariate Proportional Hazard Model Analaysi*

Description

Returns a data frame that is suitable for time-dependent covariate Cox model fit.

Usage

```
make.timedep.dataset(dat, X, d, baseline.ageyrs, t.1, t.2 = NULL)
```

Arguments

dat	data frame
X	string. Name of the followup time column in dat. Unit needs to be years.
d	string. Name of the followup time column in dat.
baseline.ageyrs	string. Name of the followup time column in dat.
t.1	numerical. Cutoff for age group
t.2	numerical. Second cutoff for age group

Details

The function assumes that the followup length is such that only one change of age group is possible.

Value

Returns a data frame with the following columns added: tstart, tstop, .timedep.agegrp, .baseline.agegrp

tstart	left bound of time interval
tstop	right bound of time interval
.timedep.agegrp	time-dependent age group
.baseline.agegrp	baseline age group

Author(s)

Youyi Fong

References

Therneau, T. and Crowson, C. Using Time Dependent Covariates and Time Dependent Coefficients in the Cox Model. A vignette from the R package surival. Fong, Y. and Halloran, M.E. Time-varying Age Group Analysis in Vaccine Efficacy Trials. In prep.

Examples

```
library(survival)

n=3000; followup.length=5; incidence.density=0.015; age.sim="continuous"

dat.0=sim.dat.tvarying.two(n, followup.length, incidence.density, age.sim, seed=1)
dat=subset(dat.0, for.non.tvarying.ana, select=c(ptid, X, d, baseline.age, trt))
```

```
dat.timedep = make.timedep.dataset (dat, "X", "d", "baseline.age", 6)
coxph(Surv(tstart,tstop,d) ~ trt*.timedep.agegrp, dat.timedep)
```

`math.functions` *Math Functions*

Description

H calculates entropy.

Usage

```
as.binary(n, base = 2, r = FALSE)

binom.coef(n, m)

expit(x)

logDiffExp(logx1, logx2)

logit(x)

logMeanExp(logx, B = NULL)

logSumExp(logx)

logSumExpFor2(logx, logy)

permn(x, fun = NULL, ...)

Stirling2(n, m)

interpolate(pt1, pt2, x)
```

Arguments

n	
base	
r	
m	
pt1	a vector of length 2
pt2	a vector of length 2
x	

logx1

logx2

logx

B

logy

fun

...

Examples

```
H(rep(1/5,5))
H(rep(3,5))
```

---

matrix.array.functions

Matrix and Array Functions

Description

concatList returns a string that concatenates the elements of the input list or array

Usage

```
AR1(p, w)

concatList(lis, sep = "")

EXCH(p, rho)

fill.jagged.array(a)

getMidPoints(x)

getUpperRight(matri, func = NULL)

last(x, n = 1, ...)

mix(a, b)

## S3 method for class 'data.frame'
rep(x, times = 1, ...)

## S3 method for class 'matrix'
rep(x, times = 1, each = 1, by.row = TRUE, ...)
```

```
## S3 method for class 'matrix.block'
rep(x, times = 2, ...)

shift.left(x, k = 1)

shift.right(x, k = 1)

thin.rows(dat, thin.factor = 10)

ThinRows(dat, thin.factor = 10)

tr(m)
```

Arguments

p	
w	
lis	list or array
sep	
rho	
a	
x	
matri	
func	
n	
...	
b	
times	
each	
by.row	
k	
dat	
thin.factor	
m	

Examples

```
concatList(1:3,"_")
```

matrix2 *Matrix Functions that May Be Faster than*

Description

DXD computes D %*% X %*% D, where D is a diagonal matrix. tXDX computes t(X) %*% D %*% X. symprod computes S %*% X for symmetric S. txSy computes t(x) %*% S %*% y for symmetric S.

Usage

```
DXD(d1, X, d2)

tXDX(X,D)

symprod(S, X)

txSy(x, S, y)

.as.double(x, stripAttributes = FALSE)
```

Arguments

d1	a diagonal matrix or an array
d2	a diagonal matrix or an array
x	array
y	array
S	symmetric matrix
X	matix
D	matix
stripAttributes	boolean

Details

.as.double does not copying whereas as.double(x) for older versions of R when using .C(DUP = FALSE) make duplicate copy of x. In addition, even if x is a 'double', since x has attributes (dim(x)) as.double(x) duplicates

The functions do not check whether S is symmetric. If it is not symmetric, then the result will be wrong. DXD offers a big gain, while symprod and txSy gains are more incremental.

Author(s)

Krisztian Sebestyen

Examples

```
d1=1:3
d2=4:6
X=matrix(1:9,3,3)
all(DXD(d1, X, d2) == diag(d1) %*% X %*% diag(d2))

S=matrix(c(1,2,3,2,4,5,3,5,8),3,3)
X=matrix(1:9,3,3)
all( symprod(S, X) == S %*% X )

x=1:3
y=4:6
S=matrix(c(1,2,3,2,4,5,3,5,8),3,3)
txSy(x, S, y) == drop(t(x)%*%S%*%y)
```

`misc` *Misc Functions*

Description

Misc functions. summ computes iterative sum, sort of like diff.

Usage

```
pava (x, wt = rep(1, length(x)))
summ(x)
sample.for.cv (dat, v, seed)
empty2na(x)
```

Arguments

`dat`	a data frame. One of the columns must be named y and y should be 0/1 with 1 for case and 0 for control
`v`	v-fold cross validation
`seed`	seed for random number generators
`x`	
`wt`	

Details

sample.for.cv: case and controls are sampled separately.

Value

sample.for.cv returns a list of two vector of integers: train and test, which refer to the rows of dat

---

plotting *Plotting Functions*

Description

mypostscript and mypdf sets the width and height based on mfrow input.

Usage

```
abline.pt.slope(pt1, slope, x2=NULL, ...)

abline.pts(pt1, pt2 = NULL)

butterfly.plot(dat, dat2 = NULL, add = FALSE, xaxislabels = rep("", 4), x.ori = 0,
    xlab = "", ylab = "", cex.axis = 1, ...)

empty.plot()

getMfrow(len)

myhist (x, add.norm=TRUE, col.norm="blue", ...)

myforestplot(dat, xlim=NULL, xlab="", main="", col.1="red", col.2="blue",
 plot.labels=TRUE,order=FALSE,decreasing=FALSE, vline=TRUE,cols=NULL,log="")

my.interaction.plot(dat, x.ori = 0, xaxislabels = rep("", 2), cex.axis = 1, add = FALSE,

    col.deming=4,add=FALSE,log="",same.xylim=FALSE,xlim=NULL,ylim=NULL, ...)
```

Arguments

add.norm	Boolean, whether to add normal approximation density line
col.norm	string, color of added normal density line
pt1	
ladder	
slope	
friedman.test.formula	
reshape.id	
impute.missing.for.line	
cor.	
mydev	
jitter	Boolean
add.interaction	Boolean

Details

myboxplot shows data points along with boxes. The data poins are jittered and the pattern of jittering is made reproducible in repeated calls. The test can only take one type of test currently.

myforestplot is modified from code from Allan deCamp/SCHARP. dat should have three columns. first column should be point estimate, second and third lci and uci, fourth p value. col.1 is the color used for CIs that do not include null, col.2 is used for CIs that do include null. If order is TRUE, the rows are ordered by the first column of dat. descreasing can be used to change the behavior of order.

corplot.formula uses MethComp::Deming by Bendix Carstensen to fit Deming regression.

wtd.hist is copied from weights package, author: Josh Pasek.

mymatplot will use na.approx (zoo) to fill in NA before plotting in order to draw continuous lines. The filled-in values will not be shown as points.

Examples

```
myfigure(mfrow=c(1,2))
    plot(1:10)
    plot(1:10)
mydev.off(ext="png,pdf", file="tmp")

set.seed(1)
x=1:50+rnorm(50,0,4)
y=1:50+rnorm(50,0,4)
dat=data.frame(x, y)
corplot(y~x,dat,add.lm.fit=TRUE,add.deming.fit=TRUE,col.lm="red",col.deming="blue")
```

print.functions *Print Functions*

Description

roundup prints a specified number of digits after decimal point even if 0s are needed at the end. formatInt prints a specified number of digits before decimal point even if 0s are needed at the beginning.

Usage

```
formatInt(x, digits, fill = "0", ...)

make.latex.coef.table(models, model.names = NULL, row.major = FALSE, round.digits = NULL)

mytex (dat = NULL, file.name = "temp", digits = NULL, display
                 = NULL, align = "r", include.rownames = TRUE,
                 include.colnames = TRUE, col.headers = NULL, comment =
                 FALSE, floating = FALSE, lines = TRUE, hline.after =
                 NULL, add.to.row = NULL, sanitize.text.function =
                 NULL, append = FALSE, preamble = "", stand.alone =
                 TRUE, caption = NULL, label = paste("tab",
                 last(strsplit(file.name, "/")[[1]]), sep = " "),
                 table.placement = "h!", verbose = FALSE, ...)

mytex.begin(file.name, preamble = "")

mytex.end(file.name)

mywrite(x, ...)

mywrite.csv(x, file = "tmp", row.names = FALSE, digits = NULL, ...)

roundup (value, digits, na.to.empty=TRUE)

formatDouble(value, digits, na.to.empty=TRUE)
```

Arguments

include.colnames	Boolean
col.headers	string. Column headers
comment	Boolean, whether to include the version and timestamp comment
hline.after	vector

add.to.row a list
sanitize.text.function
a function
stand.alone Boolean. If true, only one latex file that is stand alone file is made; otherwise both a file that is to be inputted and a standalone version are made
caption
label default to be the same as file.name stem
table.placement

na.to.empty

`random.functions` *Random Functions*

Description

rbern generates Bernoulli random variables.

Usage

```
dbern(x, prob, log = FALSE)

dcorbern(x, p, a, log = FALSE)

dmixnorm(x, mix.p, sd1, sd2, log = FALSE)

dnorm.norm.gamma(x, p, same.distr = FALSE, log = FALSE)

rbern(n, prob, generalized = FALSE)

rbigamma(n, shape.1, shape.2, rate.1, rate.2, rho)

rbilogistic(n, loc.1, loc.2, scale.1, scale.2, rho)

rejective.sampling(N, n, pik)

rnorm.cor(n, mu, sd, alpha)

rnorm.norm.gamma(n, mu.0, lambda, alpha, beta)

rmixnorm (n, mix.p, mu1, mu2, sd1, sd2)

rdoublexp(n, location=0, scale=1)
ddoublexp(x, location=0, scale=1)
qdoublexp(p, location=0, scale=1)
pdoublexp(q, location=0, scale=1)

rbidoublexp(n, loc.1, loc.2, scale.1, scale.2, rho)
```

Arguments

q

location

beta

loc.1

loc.2

scale.1

scale.2

rate.1

rate.2

shape.1

shape.2

rho

Details

rbilogistic generates a bivariate logistic distribution for correlation coefficient 0.5, or [-0.271, 0.478]. In the former case it is generated by calling `rbilogis`, part of the VGAM package; in the latter case it is generated via the AMH copular.

Examples

```
set.seed(1)
rbern(n=10, p=1/2)
rbern(n=2, p=c(.999,.001))
```

regression.model.functions
Regression Model Functions

Description

getFormattedSummary prints a table of regression coefficient estimates and standard errors.

Usage

```
getFormattedSummary(fits, type = 2, est.digits = 2, se.digits = 2, robust,
         random = FALSE, VE = FALSE, to.trim = FALSE, rows =
         NULL, coef.direct = FALSE, ...)

Details

getFormattedSummary: from a list of fits, say lmer, inla fits, return formatted summary controlled by "type". For a matrix, return Monte Carlo variance random=TRUE returns variance components type=1: est type=2: est (se) type=3: est (2.5 percent, 97.5 percent) type=4: est se

getFixedEf returns a matrix, first column coef, second column se,

getFixedEf.matrix used to get mean and sd from a jags or winbugs sample, getVarComponent.matrix and getFixedEf.matrix do the same thing. Each column of samples is a variable

interaction.table expects coef and vcov to work with fit.

Examples

```
## Annette Dobson (1990) "An Introduction to Generalized Linear Models".
## Page 9: Plant Weight Data.
ctl <- c(4.17,5.58,5.18,6.11,4.50,4.61,5.17,4.53,5.33,5.14)
trt <- c(4.81,4.17,4.41,3.59,5.87,3.83,6.03,4.89,4.32,4.69)
group <- gl(2, 10, 20, labels = c("Ctl","Trt"))
weight <- c(ctl, trt)
lm.D9 <- lm(weight ~ group)
glm.D9 <- glm(weight ~ group)
getFormattedSummary (list(lm.D9, glm.D9), robust=FALSE)
```

---

sim.dat.tvarying.two *Simulation Functions for Time-dependent Proportional Hazard Model*

Description

sim.dat.tvarying.three simulates from a model with time varing age group variale of three levels, sim.dat.tvarying.two two.

Usage

```
sim.dat.tvarying.three(n, followup.length, incidence.density,
    age.sim = c("tvaryinggroup", "baselinegroup", "continuous","bt"),
    random.censoring.rate = 0.05, seed)

sim.dat.tvarying.two(n, followup.length, incidence.density,
    age.sim = c("tvaryinggroup", "baselinegroup", "continuous","bt"),
    random.censoring.rate = 0.05, seed)
```

Arguments

n	integer. Sample size.
followup.length	numeric. Length of followup, in years.
incidence.density	numeric. Incidence rate per year.
age.sim	string. Choose between one of three possibilities. tvaryinggroup: age group is time-varying covariate; baselinegroup: age group is a baseline covariate; continuous: age is a continuous covariate; bt: age group by treatment interaction uses baseline age group, while age group main effect uses time-dependent age group
random.censoring.rate	numeric. Amount of random censoring.
seed	integer. Random number generator seed.

Details

In sim.dat.tvarying.three, baseline age is uniformly distributed between 2.0 and 16.0, and divivded into three groups at 6 and 12. In sim.dat.tvarying.two, baseline age is uniformly distributed between 2.0 and 12.0, and divivded into two groups at 6.

Value

Return a data frame with the following columns:

`ptid`	subject identifier
`trt`	treatment indicator 0/1
`for.non.tvarying.ana`	Boolean, used to subset dataset for non-time dependent analysis
`C`	censoring time
`baseline.age`	age years at baseline
`agegrp`	a factor with levels `[0,6)` `[6,12)` `[12,100)`
`baseline.agegrp`	a factor with levels `[0,6)` `[6,12)` `[12,100)`
`tstart`	left bound of time interval
`tstop`	right bound of time interval
`d`	event indicator
`X`	followup time, in years

Author(s)

Youyi Fong

`make.timedep.dataset`

Examples

```
library(survival)

dat=sim.dat.tvarying.three(n=6000,followup.length=3, incidence.density=0.05,
    age.sim="tvaryinggroup", seed=1)
f.tvarying = Surv(tstart,tstop,d) ~ trt*agegrp
f =          Surv(X,d)            ~ trt*baseline.agegrp
fits=list()
fits[["tvarying"]]=coxph(f.tvarying, dat)
fits[["baseline"]]=coxph(f, subset(dat, for.non.tvarying.ana))
fits
```

stat.functions *Stat Functions*

Description

H calculates entropy.

Usage

```
H(p, logbase = c("e", "2"))

mutual.info(two.way.table, logbase = c("e", "2"))

cor.mixed(x, ...)

## Default S3 method:
 cor.mixed(x, na.fun, method=c("pearson","spearman"), ...)
## S3 method for class 'vector'
 cor.mixed(x, y, na.fun, method=c("pearson","spearman"), ...)
## S3 method for class 'formula'
 cor.mixed(formula, data, na.fun, method=c("pearson","spearman"), ...)

skew (x, na.rm = FALSE)

info.cor(two.way.table)

yule.y(two.by.two.matrix)

kappa.cor(two.by.two.matrix, weight = c(1, 1), maximum = FALSE)

l.measure(two.by.two.matrix)
```

Arguments

p	either a count vector or a probability vector, but can not be a vector of membership indicator
logbase	
na.rm	
two.way.table	
x	
...	

na.fun

method

y

formula

data

H(rep(3,5))
```

`string.functions` *String Functions*

Description

%+% concatenates its arguments and returns a string.

Usage

```
a %+% b

a %.% b

contain(s1, s2)
trim (x, trim.trailing=TRUE, trim.leading=TRUE)

escapeUnderline(name)

fileStem(file.name)

firstIndex(s1, s2)

getExt(file.name)

getFileStem(file.name)

getStem(file.name)

lastIndex(s1, s2)
```

```
myprint(object, ...)

## Default S3 method:
myprint(..., newline = TRUE, digits = 3)

remove.prefix(s, sep = "_")
```

Arguments

a

b

s1

s2

name

file.name

object

...

newline

digits

s

sep

x

trim.leading

trim.trailing

Examples

```
x=1
x %.% "b" %.% "c"
```

---

testing.functions *Testing Functions*

Description

Testing functions.

Usage

```
hosmerlem(y, yhat, g = 10)

quick.t.test(x, y, var.equal = FALSE)

signtest(x)

tukey.mtest(mu, ms, n)

vector.t.test(mean.x, mean.y, var.x, var.y, n)

myfisher.test(x,y,...)
```

Arguments

```
...
y
yhat
g
x
var.equal
mu
ms
n
mean.x
mean.y
var.x
var.y
```

Examples

```
signtest(runif(10))
```

VEplot *Vaccine Efficacy Plots*

Description

Vaccine efficacy plots.

Usage

```
VEplot (object, ...)

## S3 method for class 'cox.zph'
 VEplot(object, resid = TRUE, se = TRUE, df = 4, nsmo = 40,
    var, ylab="VE", xlab="Time", xaxt="s", cex.axis=1, ...)

myplot.cox.zph (x, resid = TRUE, se = TRUE, df = 4, nsmo = 40, var,
    coef.transform=NULL,
    ylab=NULL,
    xlab="Time", xaxt="s", cex.axis=1,
    ...)
```

Arguments

object	An object
x	An object of type cox.zph
resid	Boolean, whether to plot residuals
se	Boolean, whether to plot confidence band
df	degrees of freedom
nsmo	number of points used to plot the fitted spline
var	estimated variance matrix from the Cox model fit
xlab	x label
xaxt	x axis
cex.axis	cex for axis
ylab	y label
coef.transform	a function to transform Cox hazard ratio estimate
...	additional parameters

Details

VEplot and myplot.cox.zph are extensions of survival::plot.cox.zph to plot VE curve and other transformations.

myplot.cox.zph adds the following parameters to the original list of parameters in plot.cox.zph: coef.transform: a function to transform the coefficients ylab: y axis label xlab: x axis label

Author(s)

Youyi Fong, Dennis Chao
